

Exercise 1.13. Prove that $\text{Fib}(n)$ is the closest integer to $\phi^n/\sqrt{5}$, where $\phi = (1+\sqrt{5})/2$. Hint: Let $\psi = (1-\sqrt{5})/2$. Use induction and the definition of the Fibonacci numbers (see section 1.2.2) to prove that $\text{Fib}(n) = (\phi^n - \psi^n)/\sqrt{5}$.

Proof. As is indicated in the problem, in order to prove that $\text{Fib}(n)$ is the closest integer to $\phi^n/\sqrt{5}$, we had better prove

Lemma. $\text{Fib}(n) = (\phi^n - \psi^n)/\sqrt{5}$ for all n greater than 0.

first.

Well, let's go! Inspired by the hint given above, the lemma $\text{Fib}(n) = (\phi^n - \psi^n)/\sqrt{5}$ can be prove through mathematical induction.

Base Case: ($n = 0$) $\text{Fib}(0)$ is true because $\text{Fib}(0) = 0 = (\phi^0 - \psi^0)/\sqrt{5}$, and ($n = 1$) $\text{Fib}(1)$ is also true by $\text{Fib}(1) = 1 = \frac{(\phi^1 - \psi^1)}{\sqrt{5}} = \frac{(\phi^1 - \psi^1)}{\sqrt{5}}$.

Inductive Step: Suppose that $n \geq 2$ and ($n = k$) $\text{Fib}(k)$ and ($n = k + 1$) $\text{Fib}(k + 1)$ holds where $\text{Fib}(k) = (\phi^k - \psi^k)/\sqrt{5}$ and $\text{Fib}(k + 1) = (\phi^{k+1} - \psi^{k+1})/\sqrt{5}$. We must show that ($n = k + 2$) $\text{Fib}(k + 2)$ holds, namely, that $\text{Fib}(k + 2) = (\phi^{k+2} - \psi^{k+2})/\sqrt{5}$. Having been mentioned in the problem, we can use the defintion of the Fibonacci numbers

$$\phi^2 = \phi + 1 \text{ (or } \psi^2 = \psi + 1 \text{ identically)}$$

to help us to argue:

$$\begin{aligned} \text{Fib}(k+2) &= \text{Fib}(k) + \text{Fib}(k+1) \\ &= \frac{(\phi^k - \psi^k)}{\sqrt{5}} + \frac{(\phi^{k+1} - \psi^{k+1})}{\sqrt{5}} \\ &= \frac{\phi^k + \phi^{k+1} - (\psi^k + \psi^{k+1})}{\sqrt{5}} \\ &= \frac{\phi^k(1 + \phi) - \psi^k(1 + \psi)}{\sqrt{5}} \\ &= \frac{\phi^k \phi^2 - \psi^k \psi^2}{\sqrt{5}} \\ &= \frac{(\phi^{k+2} - \psi^{k+2})}{\sqrt{5}} \end{aligned}$$

Therefore, ($n = k + 2$) $\text{Fib}(k + 2)$ holds for every $n \geq 2$, which completes the proof of Lemma by strong induction that $\text{Fib}(n)$ holds for all $n \geq 0$.

In order to approach to the final conclusion, notice that the value of ψ^n keeps oscillating between the negative real number $\phi = (1-\sqrt{5})/2$ and the positive integer $\phi^0 = 1$ with its sign changing alternately as n varies. So,

it becomes insignificant as n going larger and larger. Therefore, $\text{Fib}(n)$ is the closest integer to $\phi^n/\sqrt{5}$. \square
